Understanding Nonsuicidal Self Injury Origins

Nonsuicidal self injury (NSSI) is the deliberate damaging of one’s own body tissue in the absence of any intent to die. Although reports of this behavior span centuries, reported instances of NSSI have increased dramatically over the last 20 years. Formerly called self-mutilation, NSSI is the deliberate and direct alteration or destruction of healthy body tissue without suicidal intent. These behaviors range from skin cutting or burning to eye enucleation or amputation of body parts. In understanding nonsuicidal self injury origins assessment and treatment, Nock (2009) notes that NSSI classification uses concepts and terminology with which most psychiatrists are familiar and takes into account patients who have comorbid psychiatric disorders. It is based on atheoretical descriptive observations and fits into what might be regarded as a medical model.

Understanding Nonsuicidal Self-Injury: Origins, Assessment, and Treatment, edited by Matthew K. Nock (American Psychological Association) is a must-read for both researchers and clinicians including psychologists, psychiatrists, social workers, nurses, and others who work with young people. It is also recommended reading for parents and youth.

The book covers the basics of self-injury prevalence and risk factors related to child guidance and discusses the latest research on predictive factors that contribute to the highest levels of self-injury risk. It also examines the mechanisms of self-injury behaviors and how these can be treated. The contributors provide an overview of the different models of self-injury, including the cognitive-behavioral, the interpersonal, and the biological models.

In addition to the research and clinical perspectives, the book includes case studies that illustrate the practical application of the theories and models discussed. Part 3 focuses on assessment and treatment strategies for self-injury, while Part 4 explores the role of technology in self-injury.
